

Function generator

Date: Jun 2024

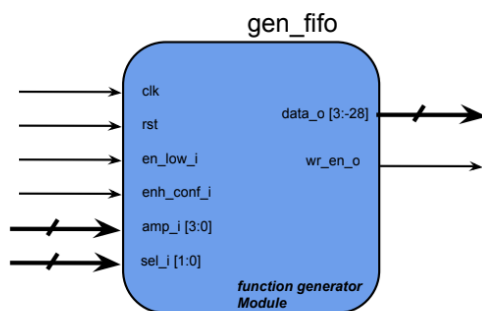

RTL

Description

Function generator module. The module has a selector to choose between the following four functions:

- Sine
- Cosine
- Triangular
- Square

- 1) It is possible to set the output signal amplitude with a integer range from 1 to 7. When amplitude is change, the function is reset. When the amplitude takes negative values , it allows the output signal to be inverted.
- 2) To modify the amplitude, the configuration enable must be set to 1. During the period that enh_conf_i is set, no signal will be generated and wr_en_o will be disabled.
- 3) The function period is 256 clock cycles. Considering a clock frequency of 100MHz (Period = 10ns), each period of the generated function would be 2.56us and its frequency would be approximately 390.6 KHz.
- 4) When the reset is activated all the signals are initialized at the position 0 of their respective LUT, which for each signal is as follows:
 - Sine = 0
 - Cosine = Amplitude
 - Square = Amplitude
 - Triangular = 0
- 5) When the enable is activated the signal at the output will continue at the point where it stopped previously, if a different function is selected, the new waveform will continue in the direction of the LUT where the previous function stopped since all four functions will use the same direction.
- 6) The format used to represent the values of the functions is fixed point 4.28. Where QI=4 and QF=28. This analysis was performed with Matlab and the code is shown in the corresponding section below. Representation of negative numbers was implemented with 2's complement.

<i>Input</i>	<i>Size</i>	<i>Description</i>	<i>Source</i>
clk	1	Clock	Clock source
rst	1	Asynchronous reset activated	Main input
en_low_i	1	Operation enable. This enable activates the operation of the module when it is set to zero. When en_low_i = 1, the module stops its operation at the point where it was and data_o retain their value until the enable is re-asserted.	Main input (full / FIFO)
enh_conf_i	1	Configuration enable. This signal enables the amplitud change.	Main inout
amp_i	4	Amplitude of the function. It can take the integer values -7, -6, -5, -4, -3, -2, -1, 1, 2, 3, 4, 5, 6 and 7 in	Main input

		a 2's complement format. It determines the amplitude of the output signal. Binary values 0000 and 1000 are forbidden, when the input takes these values and enh_config_i=1, the amplitude will not be modified.	
sel_i	2	Function selector Allows to select which waveform is the one we want to obtain in the output of the module. The function of each value of this signal is described in a table below.	Main input
<i>Output</i>	<i>Size</i>	<i>Description</i>	<i>Source</i>
data_o	32	Data of the generated function	Top module
wr_en_o	1	This signal indicates that the data at the output are valid and will be written to a destination memory.	Top module

Table 1: Inputs/Outputs description

Internal sub-modules:

- Adder module
- Multiplication module
- Register module
- LUT
- FSM module
- Mux module

Sub-modules

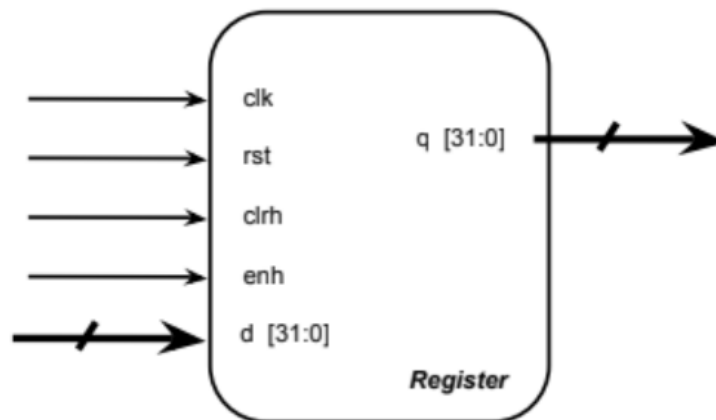

1. Adder: 3-input adder with enable and clear. The addition is performed combinationaly when the enable is active. The output is zero when the clear is activated. The clear signal has priority.

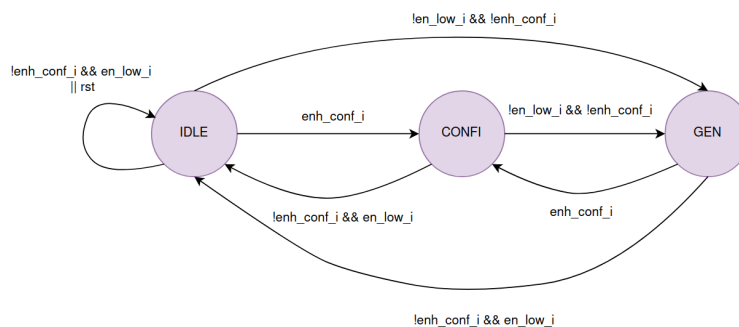

- Multiplier: 2-input multiplier with enable. Multiplication is performed combinational when the enable is active.

- Register: Type D flip flop register activated on positive clock edge with enable active high and clear active high

- FSM: The state machine will control the enable of the internal modules, when to clear the information from the registers and the sequential operation of the whole RTL.

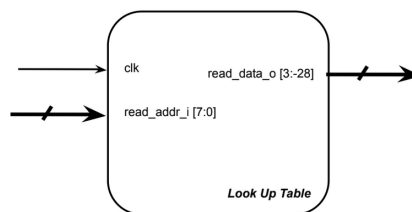

State	Signals
IDLE	clrh_addr_fsm = 1 enh_gen_fsm = 0 enh_config_fsm = 0
CONFI	clrh_addr_fsm = 1 enh_gen_fsm = 0 enh_config_fsm = 1
GEN	clrh_addr_fsm = 0 enh_gen_fsm = 1 enh_config_fsm = 0

5. Mux: 4-input 1-output multiplexer with a 2-bit selector switch. The output signal corresponds to the selector value (0 to 3). Inputs and outputs are signed.

sel_i value	Output signal
0	Sine
1	Cosine
2	Triangular
3	Square

6. LUT: Stores the values of the functions. It only has the operation of reading by means of an address. Its content is loaded by means of a txt file in hexadecimal. The reading is sequential on the positive edge of the clock. Information on each function can be found in the annexes section.

Fixed point analysis

To obtain the values of the functions in their fixed point representation, the following code was implemented in Matlab, which results in the 256 values of each function in decimal and binary.

```
2 fmax = 1; Fs = fmax*255;
3 Time = 0:1/Fs:1; %%
4 amplitud=1;
5
6 %signals
7 cosine_s = amplitud*cos(2*pi*fmax*Time);
8 sine_s = amplitud*sin(2*pi*fmax*Time);
9 triangular_s = amplitud*sawtooth(2*pi*fmax*Time+1.561, 1/2);
10 square_s = amplitud*square(2*pi*fmax*Time);
11
12 %Analysis
13 WordLength = 32;
14 QI_sinusoid = 4; %%Integers
15 QF_sinusoid = WordLength-QI_sinusoid; %%Fraction
16
17 signal_sin_dec = fi(sine_s,1,WordLength,QF_sinusoid)
18 signal_sin_bin = bin(fi(sine_s,1,WordLength,QF_sinusoid))
19 fileSINE = fopen('sin_dec.txt','w');
20 fprintf(fileSINE,'%1.4f \n',signal_sin_dec);
21
22 signal_cos_dec = fi(cosine_s,1,WordLength,QF_sinusoid)
23 signal_cos_bin = bin(fi(cosine_s,1,WordLength,QF_sinusoid))
24 fileCOSINE = fopen('cos_dec.txt','w');
25 fprintf(fileCOSINE,'%1.4f \n',signal_cos_dec);
26
27 signal_trian_dec = fi(triangular_s,1,WordLength,QF_sinusoid)
28 signal_trian_bin = bin(fi(triangular_s,1,WordLength,QF_sinusoid));
29 fileTRIANG = fopen('triangular_dec.txt','w');
30 fprintf(fileTRIANG,'%1.4f \n',signal_trian_dec);
31
32 signal_squa_dec = fi(square_s,1,WordLength,QF_sinusoid)
33 signal_squa_bin = bin(fi(square_s,1,WordLength,QF_sinusoid));
34 fileSQUA = fopen('square_dec.txt','w');
35 fprintf(fileSQUA,'%1.4f \n',signal_squa_dec);
```

With the fixed point representation 4.28, the minimum fraction that can be represented is 0.00000000372529029846 both positive and negative. The range of 4-bits 2's complement integers is -8 to 7.

Binary type: signed 8-bit

Binary:

0.000000000000000000000000000001

Decimal:
